Forbes (http://www.forbes.com) is basically a business magazine, but its website has a blog which contains articles regarding business, personal finance, entrepreneurs, technology, education, leadership, and markets.

Problem:

The user wants to stay up to date with these news articles. He/she wants to get not just the latest news but also the old ones, in case he/she didn't get the time to read the old ones. He/She also wants the ability to share an article on their social network or through any other medium.

Proposed Solution:

An android app that periodically fetches the latest news from the server and store them into a SQLite database. The app can store up to 100 news stories. When new stories/articles are fetched the user is notified. The user can then select one of the articles and read them within the app using a WebView, and if the user likes the article he/she can share it.
